

Connection Pooling in JDBC

Kishan

Connection Pooling:

- Connection Pooling is a technique used in Java Database Connectivity (JDBC) to improve application performance by efficiently managing database connections.
- Instead of creating a new connection for every database interaction, a connection pool maintains a pool of pre-established connections, that are ready to be reused.
- This reduces the overhead of connection creation and termination, leading to significant performance gains.

Q) How Connection Pooling Works?
