Program Details (With Test Cases)

Program 1: BankApplication

Languages: java

Score (010):	10 / 10		
Test Case Summary:	Total: 5		Passed: 5
	Failed: 0		Success: 100.0%

Attempts:	0
Submitted At:	12/2/2025, 10:57:39 AM

Description: Create a Bank Application project by using Method Overriding Concept to display different kinds of account details and calculate interest rate on each different types of account like saving account, Current account and Fixed deposit account. Validate all the inputs properly and generate error message, if any input is not appropriate.

Create a BLC class called BankAccount
Fields :
accountHolderName String protected
accountNumber String protected
   balance double protected
   IFSC_CODE public static final String (Initialize the IFSC CODE at the time of declaration,
   will be common for all the Objects)

   Use a parameterized constructor to initialize all the fields, In this constructor provide
   error message, if inputs are not in valid format like (see test cases for more details)
a)Account holder name cannot be empty.
b)Account number cannot be empty.
c)Balance cannot be negative.

Methods :

1) Method Name   : calculateInterest()
Argument   : No Argument
Return Type   : void
Access modifier   : public
In this method write a generic message regarding Bank interest Calculation.

2) Method Name   : displayAccountDetails()
Argument   : No Argument
Return Type   : void
Access modifier   : public
In this method display customer records [See the Test cases for more details in the below
of this question]

Create another BLC class SavingsAccount which is sub class of BankAccount

Field :
protected double interestRate = 4.0;

Take a parameterized constructor to initialize super class properties.

Method :

1) Method Name   : calculateInterest()
Argument   : No Argument
Return Type   : void
Access modifier   : public
In this method write a logic to calculate interest rate on Saving Account.

Create another BLC class CurrentAccount which is sub class of BankAccount

Field :
protected double overdraftLimit = 5000.0;

Take a parameterized constructor to initialize super class properties.

Method :

1) Method Name   : calculateInterest()
Argument   : No Argument
Return Type   : void
Access modifier   : public
In this method write a statement that Current accounts do not earn interest.

2) Method Name   : checkOverdraftLimit()
Argument   : No Argument
Return Type   : void
Access modifier   : public
In this method print overdraftLimit amount.

Create another BLC class FixedDepositAccount which is sub class of BankAccount

Field :
protected double interestRate = 6.5;
    depositTerm int protected;

Take a parameterized constructor to initialize super class and current class properties.
Validate the input deposit term with error message, depositTerm can't be negative.

Method :

1) Method Name   : calculateInterest()
Argument   : No Argument
Return Type   : void
Access modifier   : public
In this method write the logic to calculate the interest amount on FixedDeposit account.

Create an ELC class BankApplication with main method to test this application. Write Switch case with Scanner class to Test as shown in the below Test Cases.

Constraints: -

Sample Input: Please select the Account Type : 1) Saving Account 2) Current Account 3) Fixed Deposit Account Please enter the type of account you want to open : [1/2/3] 2 Enter account Holder Name :Scott Enter account Number :675456789765 Enter the Amount :12000

Sample Output: Account Holder: Scott Account Number: 675456789765 Balance RS :12000.0 IFSC CODE :SBIHYD151285 Current accounts do not earn interest. Overdraft limit RS :5000.0

Explanation: NA

Solution Code

```java
import java.util.*;

public class BankApplication{
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        int choice  = sc.nextInt();

        switch(choice){
            case 1 ->{
                String name  = sc.next();
                String accountNumber = sc.next();
                double balance = sc.nextDouble();
                BankAccount sa = new SavingsAccount(name, accountNumber,balance);
                sa.displayAccountDetails();
                sa.calculateInterest();
            }
            case 2 ->{
                String name  = sc.next();
```

```java
                String accountNumber = sc.next();
                double balance = sc.nextDouble();
                BankAccount ca = new CurrentAccount(name, accountNumber,balance);
                ca.displayAccountDetails();
                ca.calculateInterest();
                CurrentAccount c = (CurrentAccount)ca;
                c.checkOverdraftLimit();
            }
            case 3 ->{
                String name  = sc.next();
                String accountNumber = sc.next();
                double balance = sc.nextDouble();
                int depositTerm = sc.nextInt();
                BankAccount fda = new FixedDepositAccount(name,
accountNumber,balance,depositTerm);
                fda.displayAccountDetails();
                fda.calculateInterest();
            }
        }

    }
}

class BankAccount{
    protected String accountHolderName;
    protected String accountNumber;
    protected double balance;
    final String IFSC_CODE = "SBIHYD151285";

    public BankAccount(String accountHolderName, String accountNumber, double balance){
        if(balance<=0){
            System.out.println("Balance cannot be negative.");
            System.exit(0);
        }
        this.accountHolderName = accountHolderName;
        this.accountNumber = accountNumber;
        this.balance = balance;
    }

    public void calculateInterest(){

    }
```

```java
    public void displayAccountDetails(){
        System.out.println("Account Holder: "+accountHolderName);
        System.out.println("Account Number: "+accountNumber);
        System.out.println("Balance RS :"+balance);
        System.out.println("IFSC CODE :"+IFSC_CODE);
    }
}

class SavingsAccount extends BankAccount{
    protected double interestRate = 4.0;

    public SavingsAccount(String accountHolderName, String accountNumber, double
balance){
        super(accountHolderName,accountNumber,balance);
        this.interestRate = interestRate;
    }
    public void calculateInterest(){
        double interest  = (balance*interestRate)/100;
        System.out.println("Savings Account Interest RS :"+interest);
    }

}

class CurrentAccount extends BankAccount{
    protected double overdraftLimit = 5000.0;

    public CurrentAccount(String accountHolderName, String accountNumber, double
balance){
        super(accountHolderName,accountNumber,balance);
    }
    public void calculateInterest(){
        System.out.println("Current accounts do not earn interest.");
    }

    public void checkOverdraftLimit(){
        System.out.println("Overdraft limit RS :"+overdraftLimit);

    }
}
class FixedDepositAccount extends BankAccount{
```

```java
    protected double interestRate = 6.5;
    protected int depositTerm;

    public FixedDepositAccount(String accountHolderName, String accountNumber, double
balance,int depositTerm){
        super(accountHolderName,accountNumber,balance);
        if(depositTerm <=0){
            System.out.println("Deposit term must be positive.");
            System.exit(0);
        }
        this.depositTerm = depositTerm;
    }
    public void calculateInterest(){
        double interest  = (interestRate/100)*depositTerm*balance;
        System.out.println("Fixed Deposit Interest for 5 years RS :"+interest);
    }

}
```
